

## FRACTURING PUMP & BLENDING UNIT

Franklin Well Services, Inc. is the largest oil and gas service company in the Illinois Basin. Franklin always takes the lead in equipment innovation. Our fracturing units provide accurate sand density control by the use of a densitometer to measure the sand concentration real time in PPG.

All of our fracturing units have densitometers, flow meters, pressure transducers installed on them, and these parameters are monitored throughout the job.

The average fracturing company can only guess at the density of the sand slurry while pumping. With the densitometer always running real time on our units, there is no guessing. The pump operator sees the actual density in PPG as it is being pumped down well.

Franklin has both 650 HHP pumpers and 950 HHP pumpers available.
